

JobMatchU

Abstract

The aim of this project is to create a web-based platform that connects part-time job seekers, primarily students, with job providers who are looking for part-time workers. The platform will allow students to create a profile, search for jobs based on their preferences, apply for jobs, and communicate with job providers through a built-in chat system. Job providers will also be able to create a profile, post jobs, review applications, and hire students through the platform. Additionally, the platform will include a feature for mentorship, where experts in different fields can mentor students seeking guidance in that profession. The system will be designed with a focus on security, scalability, and maintainability. By creating a platform that simplifies the process of finding part-time work, we hope to provide a valuable resource for students and job providers alike.
